DETAILED ACTION

Election/Restrictions

1. Applicant's election of Species A, claims 1-5,9-21 readable on figs. 1-5 in the reply filed on 10/04/2004 is acknowledged. Because applicant did not distinctly and specifically point out the supposed errors in the restriction requirement, the election has been treated as an election without traverse (MPEP § 818.03(a)).

Claim Rejections - 35 USC § 102

2. The following is a quotation of the appropriate paragraphs of 35 U.S.C. 102 that form the basis for the rejections under this section made in this Office action:

A person shall be entitled to a patent unless –

(b) the invention was patented or described in a printed publication in this or a foreign country or in public use or on sale in this country, more than one year prior to the date of application for patent in the United States.

3. Claims 1-5,9-21 are rejected under 35 U.S.C. 102(b) as being anticipated by Sakurai et al. (EP 0 337 032).

Regarding claim 1 and 19, Sakurai et al. disclose a 1. A brushless permanent magnet electrical machine which comprises: a first cylindrical member/ a stator (21) having a central axis, an inner cylindrical surface (core 22 mounted on 8a) and an outer cylindrical surface (facing air gap G) and a plurality of magnetic poles extending outward from the outer cylindrical surface of the first cylindrical member, the plurality of magnetic poles provided with wire coils (C) around each of the plurality of magnetic poles; a second cylindrical member/ a rotator (14) having a central axis, an inner cylindrical surface (where magnets 18 mounted) and an outer cylindrical surface (inner of joke 17) and a plurality of permanent magnets (18) coupled to the inner cylindrical

surface of the second cylindrical member, the second cylindrical member surrounding the first cylindrical member so that the plurality of magnet poles and the plurality of permanent magnets are adjacent and spaced apart (G) from one another radially and the central axis of the second cylindrical member and the central axis of the first cylindrical member coincide and define a common central axis; a rotatable shaft that is coaxial with the common axis; and means (energized by stator) for moving the second cylindrical member with respect to the first cylindrical member along the common central axis.

Regarding claims 2-5,9-18, and 20-21, it is noted that Sakurai et al. disclose all the recited limitations.
